/note="Vector: pT7T3D-Pac (Pharmacia) with a modified
/note="Vector: pT7T3D-Pac (Pharmacia) with a modified
/note="Vector: pT7T3D-Pac (Pharmacia) with a modified
polylinker; 1st strand cDNA was prepared from pooled bulk
breast tumor tissue, and was then primed with a Not I -
oligo(dT) primer. Double-stranded cDNA was ligated to Eco
RI adaptors (Pharmacia), digested with Not I and cloned
into the Not I and Eco RI sites of the modified p7T3
vector. This library is the normalized version of
NCI_CGAP_Br1.1. Library was constructed by Bento Soares
and M. Fatima Bonaldo.

This sequence encodes human vascular endothelial growth factor 3 (YEGF3). The growth factor can be used to stimulate angiogenesis and wound healing, and to promote vascular tissue repair. It can also be used to induce the growth of damaged bone, periodontium or ligament tissue. VEGF3 antagonists can be used to inhibit tumour growth, or the treat diabetic retinopathy, inflammation, rheumatoid arthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (HUMA-) HUMAN GENOME SCI INC.

In wound healing, also related nucleic acid process for cancer diagnosis. Claim 1: Page 61-62: 107pp; English.

CC 137999-T37915 represent the coding sequences for the vascular endothelial crimesory. Proteins of the invention, which promote endothelial crimesory. Proteins of the invention, which promote endothelial crimesory. Proteins of the invention, which promote endothelial crimesory. Proteins a glycosylated cationic context in which it is found. WEGF is also a glycosylated cationic context in which it is found. WEGF is also a glycosylated cationic context in which it is found. WEGF is a potent endothelial cell mitogen, and directly contributes to induction of anglogenesis in vivo by contributed and tissue regeneration/reorganisation. The VEGF proteins cof the invention share the angiogenic and other properties of VEGF, but created and expressed in tissues differently to VEGF but a redistributed and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate anglogenesis in wound cannot be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to vEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy complements the vEGF coding sequences. Quantification of wegf-B in cancer biopsy complements the vEGF coding sequences, and indicator of metastatic risk. VEGF-B coding sequences for the invention can be used in retarding vegences for tumour cells. 235 C; 179 G; 104 T;

                                           Example 5; Fig 9; 113pp; English.

WRF186 cDNA (T13809) codes for the murine homologue (W00863) of human vascular endothelial growth factor-like polypeptide SOM175 (W00725), a protein capable of inducing astroglial proliferation and of promoting neural survival and/or proliferation. It was obtd. from a new-born mouse brain cDNA library using SOM175 cDNA (see also T33610) as probe. The murine VRF gene maps near to the centromere of chromosome 19. It is highly expressed in embryo tis and in the heart and brown fat of adult mice. An alternatively spliced variant, VRF169 (T13810), was also identified.

          TRESULT AND THE STATE OF THE ST
vascular endothelial growth factor VEGF-B proteins - useful to accelerate angiogenesis in wound healing, also related nucleic acid and antibodies for cancer diagnosis Claim 1; Page 60; 107pp; English. 737909-T37915 represent the coding sequences for the vascular endothelial growth factor (VEGF) proteins of the invention, which promote endothelial or mesodermal cell proliferation. VEGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         653

cc (VPF). VEGF has diverse effects, depending on the Special CC context in which it is found. VEGF is a potent endothelial cell mitogen, CC and directly contributes to induction of anylogenesis in vivo by CC promoting endothelial cell growth during normal embryonic development, wound healing, and tissue regeneration/reorganisation. The VEGF proteins CC of the invention share the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF. The CC proteins can therefore be used to accelerate angiogenesis in wound CC healing. Antibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to quantitatively detect VEGF. B. Primers complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy can section as an indicator of metastatic risk. VEGF-B coding sequences, this is especially useful in retarding coverness may be useful as an indicator. Secuence of the vege coding sequences, this is especially useful in retarding sequence 624 BP; 124 A; 213 C; 173 G; 114 T;

Claim 1; Page 58-59; 107pp; English.

CC 373909-737915 represent the coding sequences for the vascular endothelial crown that factor (VEGF) proteins of the invention, which promote endothelial crown that it is sometimes referred to as vascular permeability factor (VPF). VEGF has diverse effects, depending on the specific biological context in which it is found. VEGF is a potent endothelial cell mitogen, can directly contributes to induction of angiogenesis in vivo by commoting endothelial cell growth during normal embryonic development, contains the invention share the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF. The coffing can therefore be used to accelerate angiogenesis in wound healing. Antibodies against the proteins can be used for inhibiting can thiosens against the proteins can be used for inhibiting cannotiang. Antibodies can also be used diagnostically to generate so the coding sequences for the proteins can be used for inhibiting cannotiatively detect VEGF-B. Primers complementary to the coding sequences of the invention can also be used to detect vEGF-B coding sequences. Quantification of VEGF-B in cancer blopsy complements and process of the invention can also be used to detect vEGF-B coding sequences, this is especially useful in retarding complements.

CC Sequences for it tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

3 cDNA clones (T33611-13) code for splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725). They were identified in a human foetal spleen library and respectively lack exon 6, exons 6+7, and exon of the SOM175 gene (see also T33610). The CONA clones can be used to produce recombinant SOM175 proteins that are useful for inducing astroglial proliferation and for promoting neural surviving and/or proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor-like protein SOM175-e6+e7 cDNA. 3 cDNA clones (T33011-13) code for splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725). They were identified in a human foetal spleen library and respectively lack exon 6, exons 6+7, and exon of the SOM175 gene (see also T33610). The cDNA clones can be used to produce recombinant SOM175 proteins that are useful for inducing astroglial proliferation and for promoting neural surviv

3 cDNA clones (T33611-13) code for splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725). They were identified in a human foets spleen library and respectively lack exon 6, exons 6+7, and exon of the SOM175 gene (see also T33610). The CDNA clones can be used to produce recombinant SOM175 proteins that are useful for inducing astroglial proliferation and for promoting neural survices and/or proliferation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PT accelerate anylogenesis in wound healing, also related nucleic acid processis in the coding sequences for the vascular endothelial cor mesodermal cell proliferation. VEGF is also a glycosylated cattonic cdimer, and is sometimes referred to as vascular permeability factor (VPF). VEGF has diverse effects, depending on the specific biological context in which it is found. VEGF is a spotent endothelial coll growth during normal embryonic development, and directly contributes to induction of anylogenesis in vivo by contributes to induction of anylogenesis in vivo by contributed and expressed in tissue anylogenesis in vivo by collective in the invention share the anylogenic and other properties of VEGF, but care distributed and expressed in tissues differently to VEGF. The colling. Antibodies against the proteins can be used for inhibiting can be used for inhibiting sequences for the proteins of the invention can be used for inhibiting cannitatively detect VEGF-B. Primers complementary to the coding sequences, Quantification of VEGF-B in cancer biopsy complements and the vegf coding sequences. Quantification of VEGF-B in cancer biopsy complements the vEGF coding sequences, Quantification of vegf-B. Tisk. VEGF-B coding sequences, Quantification of metastatic risk. VEGF-B coding sequences of the invention can be used to detect vegf-B coding sequences, Cuantification of metastatic risk. VEGF-B coding sequences of the invention can be used to detect complements the vegf coding sequences, this is especially useful in retarding vegf-B coding sequences of the sequences of the coding antisense sequences direct coding sequences of the coding antisense sequences direct coding sequences of the coding antisense sequences direct code sequences of the coding antisense sequences of the coding code sequences of the coding code sequences of the coding code sequences of th

YRR169 cDNA (T13810) codes for a murine homologue (W00864) of an alternatively spliced variant (W00766) of human vascular endothelial growth factor-like polypeptide SOW175 (see also W00725), a protein capable of inducing astroglial proliferation and of promoting neural survival and/or proliferation. It was obtd. from a new-born mouse brain cDNA library using SOM175 cDNA (see also T33610) as probe. The murine VRF gene maps near to the centromere of chromosome 19. It is highly expressed in embryo tissue and in the heart and brown fat of adult mice. VRF169 lacks exon 6, found in VRF186 cDNA (T13809).

CS Claim 1; Page 57; 10/pp; English.

CC growth factor (VEGF) proteins of the invention, which promote endothelial CC growth factor (VEGF) proteins of the invention, which promote endothelial CC or mesodermal cell proliferation. VEGF is also a glycosylated cationic CC (VFF). VEGF has diverse effects, depending on the specific biological CC context in which it is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of angiogenesis in vivo by CC promoting endothelial cell growth during normal embryonic development, CC wound healing, and tissue regeneration/reorganisation. The VEGF but CC are distributed and expressed in tissues differently to VEGF, but CC are distributed and expressed in tissues differently to VEGF, but CC are distributed and expressed in tissues differently to VEGF, but CC are distributed and expressed in tissues differently to VEGF, but CC are distributed and expressed in tissues differently to vEGF, but CC are distributed and expressed in tissues differently to vEGF, but CC are distributed and expressed in tissues differently to vEGF, but CC are distributed and expressed in tissues differently to vEGF. But CC angiogenesis. The antibodies can also be used for inhibiting CC healing. Antibodies against the proteins can be used for inhibiting CC unnitiatively detect VEGF-B. Primers complementary to the coding sequences of the invention can also be used to detect VEGF-B coding sequences. Quantification of VEGF bin cancer biopsy CC expression in a cell can be retarded using antisense sequences direct CC against the VEGF coding sequences, this is especially useful in retarding CC VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Ma

PS Claim 1; Page 53; 107pp; English.

CC This represents a fragment of the mouse embryo vascular endothelial CC growth factor-B (VEGF-B) protein coding sequence. The encoded proteins CC (and W0486-W04831) represent the VEGF proteins of the invention, and CC promote endothelial or mesodermal cell proliferation. VEGF is also a CC glycosylated cationic dimer, and is sometimes referred to as vascular CC permeability factor (VPF). VEGF has diverse effects depending on the CC specific biological context in which it is found. VEGF is a potent CC endothelial cell mitogen, and directly contributes to induction of CC embryonic development, wound healing, and tissue CC embryonic development, wound healing, and tissue CC the angiogenesis in vivo by promoting endothelial cell growth during normal CC embryonic and other properties of VEGF, but are distributed and CC expressed in tissues differently to VEGF. The proteins can therefore he CC used to accelerate angiogenesis in wound healing. Antibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can also be used to detect VEGF-B coding sequences. Quantification of C vEGF B in cancer biopsy specimens may be useful as an indicator of mentation of the VEGF-B expression in a cell can be retarded using.

                                                                                                                                                                                                                                                                                metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences, this is especially useful in retarding VEGF expression in tumour cells. PT and antibodies for cancer diagnosis
PS Claim 1; Page 56; 107pp; English.
CC growth factor (VEGF) proteins of the invention, which promote endothelial
CC or mesodermal cell proliferation. VEGF is also a glycosylated cationic
CC dimer, and is sometimes referred to as vascular permeability factor
CC (VPF). VEGF has diverse effects, depending on the specific biological
CC context in which it is found. VEGF is a potent endothelial cell mitogen,
CC and directly contributes to induction of anglogenesis in vivo by
CC promoting endothelial cell growth during normal embryonic development,
CC wound healing, and tissue regeneration/reorganisation. The VEGF proteins
CC of the invention share the angiogenic and other properties of VEGF, but
CC are distributed and expressed in tissues differently to VEGF. The
CC angiogenesis. The antibodies can also be used diagnostically to
CC sequences for the proteins of the invention can be used for inhibiting
CC angiogenesis. The antibodies can also be used diagnostically to
CC specimens may be useful as an indicator of metastatic risk. VEGF-B
CC expression in a cell can be retarded using antisense sequences direct
CC VEGF B coding sequences. Quantification of VEGF-B in cancer biopsy
CC sequence 591 BP; 126 A; 186 C; 174 G; 105 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                   Query Match

RESULTANCE OF CONTROL OF STATE OF CONTROL OF STATE OF CONTROL OF STATE OF CONTROL OF STATE OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            retal human vascular smooth muscle cells mRNA was isolated
for the preparation of a cDNA library.
The two forms of VEFG (Q10797 and Q10917) which arise through
different message splicing, have different properties. In partic.
hVEGF121 does not bind to heparin leaving more of the protein free to
bind to VEGF receptor and increase the half-life and distribution of
the protein in circulation, whereas hBEGF165 binds heparin strongly.
The product can be used for angiogenesis and re-endothelialisation
of inner vascular surfaces in wound healing, e.g. treatment of full-
thickness wounds such as dermal ulcers, venous ulcers and diabetic
ulcers, burns, in surgery, in balloon angioplasty and for the in
vitro culturing of endothelial cells. Hybrid growth factors of PDGF
and VEGF can exhibit a mitogenic profile between each factor and
can be used for wound healing or as inhibitors of angiogenesis for
e.g. preventing the growth of tumours.

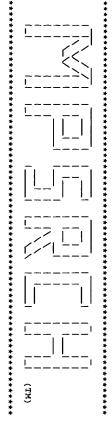

CEGF analogues in which CYS residues are substd. are more stable.
